                                                                                                                    Center: Whitehead Institute/ MIT Center for Genome Research
                                                                                                                                                                                                                                                                      sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                              Contact: sequence_submissions@genome.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

corresponding to the overlapping clone, as we submit sequences with confesponding to the overlapping clone, as we submit sequences with This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw: SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the feature table with their source databases: Em: EMBL; Sw: http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping

On Nov 1, 2001 this sequence version replaced 9::16214704.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CTCGAAGTCGTCGTCCTCTCATGCGGTGCCACGCCCATGGACCTTCTTGTCTCGTCACG

together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL: Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the sanger cac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromasome X, constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at the promp of Pieter de Jong. For further details see http://www.chori.org/Dacpac/home.htm

Submitted (05-APR-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Apr 6, 2001 this sequence version replaced gi:13274303.

During sequence assembly data is comparated from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping chromosome X, constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/ChrX RP11-167P23 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

VECTOR: pBACe3.6
IMPORTANT: This sequence is not the entire insert of clone RP11-167P23 it may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP11-465E19 is at 118925 in this sequence. The true right end of clone RP1-47K8 is at 100 in this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw.; SWISSPROT; Tr., TREMBL; WORNPEP; Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence

Direct Submission

AL Submitted (08-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire,
CBIO 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
cquests: clonerequest@sanger.ac.uk
cquence assembly data is compared from overlapping clones.
During sequence assembly data is compared from overlapping clone and together with a note of the overlapping clone and. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality) >-
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one MIS subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em: EMBL; Sw:,
SWISSPROT: Tr:, TREMBL; WP:, WORMPEPP: Information on the WORMPEP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome X. constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/ChrX RRP13-77/011 is from the library RPCI-13.1 constructed by the group of Pieter de Jong. For Lurther details see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    http://www.chori.org/bacpac/home.htm
VECTOR: pBACe3.6
This sequence is the entire insert of clone RP13-77011 The true
left end of clone RP13-97115 is at 15298 in this sequence. The true
right end of clone RP13-97115 is at 131153 in this sequence.

consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 114344;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL: Sw:, SWISSPROT: Tr:, TREMBL: WP:, WORMPEP: Information on the WORMPEP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping

This sequence is not the entire insert of clone L185E6. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions. In addition this sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where unambiguous sequence has not been obtained, there is an annotation using the 'unsure' feature key. Where the size of a problem region is known only approximately the sequence contigs on either side will be submitted as separate entries, with annotation to indicate the order and positions of neighbours and what is known about the size and nature of the gap. Contigs have entryname suffixes (A. B. ..) indicating the order of the contigs with respect to the clone.

The sequence from clone L185E6 has been finished in more than one contig. This sequence (L185E6A) is separated from the following one (L185E6B) by a 500bp gap based on restriction data. 55bp VNTR made
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HSL165E6A 100V-1999 Bund: DNA linear PRI 23-NOV-1999 Human: DNA sequence from cosmid L129H7, Huntington's Disease Region, chromosome 4p16.3 contains Pseudogene and CpG island.

Closure of gap impossible.

The true right end of clone L18FE is at 10842 in this sequence. The true left end of clone L18FE is at 1 in this sequence. L18FE is from cosmid library LAGANCO1 constructed at the Human Genome Center, Los Alamos National Laboratory, NM 87545 under the auspices of the U.S. Department of Energy. The library was constructed using flow sorted human chromosome 4 from a Hamster-Human hybrid cell line ( UV20HL21-27 ) containing human chromosomes 4, 8 and 21.
                                                                                                                                                  L185E6 is contained in a clone contig spanning
Mb which is described in Baxendale et al, Nature Genetics 4 (1993)
181-186. See also Myers et al, Cytogenet Cell Genet. 66 (1994)
218-230.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone 1E6 (L21F12) is at 6371 in this sequence. The true right end of clone 361H4 is at 104 in this sequence. This sequence has been finished according to sequence map problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the unsure feature key.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HS193G15
HS193G15
HUMAN DNA Sequence from clone 193G15 on chromosome 4. Contains the 5' part of the RGS12 gene for requilator of G-protein signalling 12, an RPL7A (66S Ribosomal Protein 7A (SURF3)) pseudogene, ESTS, an ALI17391

ALI17391.

Monuray.A. Submission

Infrect Submission

Submitted (10-JUL-1999) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databasses:

Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3;

This sequence was generated from part of bacterial clone conligs of human chromosome 4, constructed by the Sanger Centre Chromosome 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AL645949 185713 bp DNA linear HTG 06-DEC-2001
Homo sapiens chromosome 4 clone RP11-357G3, *** SEQUENCING IN
PROGRESS ***, 17 unordered pieces.
                                                                                                                                             follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
IMPORTANT: This sequence is not the entire insert of clone 193G15. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                         neighbouring submissions.
The true left end of clone 1E6 is at 6371 in this sequence. The true right end of clone 361H4 is at 104 in this sequence. This sequence has been finished according to sequence map criteria as
                                                                                                                                                                                                                                                                                               Mapping Group.
193G15 is from the library RPCI1 constructed at the Roswell Park

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                   Direct Submission

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

differentially expressed gene product in a test sample derived from cell suspected of being cancerous. They can also be used to inhibit tumour growth by modulating expression of a gene product. AAS36943-AAS39338 represent novel human diagnostic and therapeutic coding sequences of the invention.

The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they be encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression of the patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression. The sense and antisense nucleic acid molecules may be administered to down regulate their expression. The sense and antisense nucleic acids may also be treated as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be used as antigons in the production of antibodies and in assays to identify modulators (agonists and antibodies and in assays to identify modulators (agonists and antibodies and in assays to identify modulators (agonists and antibodies and in assays to identify modulators (agonists and antibodies and in assays to identify modulators (agonists and present sequence is a GENSET polypeptide expression and activity. Thus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them. (I) have orfostaric activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumourassociated proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to treat diseases by rectifying mutations or deletions in a patient's genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (1). Additionally, the NAS may be used to produce the lung-tumour associated protein, according to standard recombinar to DAM methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression by binding with the cells own genes and preventing their expression. The NA binding with the cells own genes and preventing their expression. The NA samples, and hence which patients may be in need of treatment for lung assays to detect and quantitate the presence of similar NA sequences in samples, and hence which patients may be in need of treatment for lung accorer. The (1) may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of the protein.
